Job Scheduler - Single Provider - 1 of 2

When the Job Scheduler is invoked without pre-selected hosts the users are required to fill out all the fields. All the elements are stacked in a column to imply a work-flow.

1. Users are required to select the hosts they want to perform the job on.

   • Host Collection - User creates a static list of hosts that they can consistently perform Jobs on.

   • Bookmark - User creates a Bookmark or uses a default Bookmark which will dynamically select hosts to perform tasks on.

   • Manual Selection - Users are given a dialog which they can freely enter a search query consistent with the search syntax throughout the application.

2. The applicable Providers will be displayed once the User specifies the hosts.
3. By default the Run Job Now option should be selected.

Job Scheduler - Multi-Provider - Run Job Now - 1 of 2

The Job scheduler screen will have pre-populated fields based on the Users selection from the host screens.

1. Manual Selection is selected by default with the query based on the host selection from the host screen.
2. The combination of the host selection resulted in requiring multiple providers. Just like with a single provider both should be enabled by default.

Job Detail - Repeating Job

This Job has yet to be run, but it scheduled to repeat. As a result there is no host status to display in the charts.

1. Since the Job has never been run there should be a simple message stating that there have been no previous Job runs with the next scheduled run.
2. The button should reflect the state of the Job. Since the Job is already scheduled it should say Reschedule.
